Joshua Situka July 7, 2009

If at first you don't succeed, try and try again. Yesterday OpenCV didn't want to work with me. Then I went away from it for a little bit to try and clear my head. When I came back to it, it was working. So I worked on my 3D hand tracker. That is nearly done. It's calibrated! That's great! Please don't pull an 'Office Space' hehe.

Well you know what they say. The first draft is never the last. I am currently working on the poster. Well I am currently working on a lot of things. Anyways, we went paintballing yesterday. And I was slipping and sliding into bunkers and trenches giving everything I got. I ended up having fun.

Connor Schenck

Joshua Situka July 9, 2009

Yesterday was my birthday. I was supposed to go paintballing but it just didn't work out. I am going to finish my poster today. Again. With Song's suggestions. The paper is going to get at least 20 revisions before my mentors are im not stressing. I revised my poster 10 times at least so im guessing in pictures to the results and methods. And that's it...for the first draft.

Joshua Situka July 11, 2009

Back to work today. It's one thing to get something working,...to have fun.

Anyways, we went paintballing yesterday. And I was slipping and sliding into bunkers and trenches giving everything I got. I ended up having fun.

Today, I am working on the OpenCV plugin. Yesterday, I spent most of my time working on the OpenCV plugin. It is working, but I still need to make some changes. I need to make some changes to the code so that it will capture the skin detection instead of two. I also need to make some changes to the code so that it will capture the skin detection instead of two. I also need to make some changes to the code so that it will capture the skin detection instead of two. I also need to make some changes to the code so that it will capture the skin detection instead of two.

Brett showed me some way to use the OpenCV function. I am going to try it out. I will let you know how it works.

write code.

NEGATIVE!?!?!

There goes the weekend. I never even finished the last HW.

And now I just remembered that our group has to start on the big tic-tac-toe thing. I'm really tired of reading. I'm going to take a break today.

I kinda wished they told us how to do literature review and research. And if we were given an actual class on how to do it, it would be a lot easier than we have to do it. I'm guessing this will be the same goes for our group.

Thanks Josh.

HamadiMcIntosh

that's good you have a plan

BellaManoim

As the summer goes on, I'm finding that I'm not bored easily. He deals with complicated code very easily. He got the whole thing working. I can't even get the basic color detection part to work. We even added some bells and whistles and Kelly did the last finishing touches. I'm hoping that our REAL project is going to go this way too.

Multiple finger rotation with markers - 1 weeks

one finger rotation with markers - 2 weeks

Rotate a cube with/without marks and cylinders.

OpenGL

It sounds like you will really be using computer vision and that is quite intriguing. I'm getting a bit bored of this simple shape thing.

Now on to the hand.

3D cube rotating with our hands and nothing else between the time I pick it up and the time it is finally rotated all the way around. This programming with other people thing is kinda weird at first, but it is a doctorate degree. There is an option at Iowa State to do a PhD without a thesis. There is an option at Iowa State to do a PhD without a thesis.

What you should really do is pick up an MD, then decide to something today. It will probably be right before I go to bed. I know I have to update this blog, but I don't even know what I did to fix it. The colors are very different, but the code I used is almost the same.

Now we just want to make the markers small enough to be automatically detected.

The Zcam is frustrating me. It works perfectly one day, and today I can't even get it to work. I'm trying to decide what our next step is going to be once we get the thing working, and... I think I'm going to go to bed.

Joshua Situka June 29th 2009

My cousin passed away.

I'm sorry about your cousin Josh, and that sounds very frustrating to have to go through that. I never met your cousin, but I know he was a good person.

BellaManoim

MinaChoi

Sorry, Josh.

Joshua Situka July 1st 2009

I'm noticing my creativity towards my blogs is waning. I'm thinking of the old days of i mine when I had a lot more freedom. I can get that back. I just need to find the right shape to work with. I'm going to try and work on it again.

...because codes are logical and papers aren't!!!
This is a light and its intended use is to light up rooms with light so you can see. However, its usability suffers because of safety. If you were trying to replace the bulb inside you will need at least one other person helping you because of the size of the light. Even then it would be awkward to handle and give to someone else because of the size. What would be better is to have a light that could be handled easily with one hand so that it could safely be replaced.
The Nintendo Game Cube controller on the top is intended for you to play video games interactively on a television. However, its usability suffers because it is inconsistent with many controller designs of the past. Many controllers (as seen in the X-Box 360 below) have more of a handle for you to use and the button layout is more symmetrical. Therefore, adjusting to this controller scheme is awkward for no apparent reason. They actually came out with controller's after this one that address that issues with more handle.

- Joshua Situka - 29 May 2009

So CAVS lost, which is unfortunate. But at least I can spend more time doing my research. We are probably going to do a Tic-Tack-Toe game for our C++ project, we only have a week to do it. I feel real confident about the projects that I am doing, And I still cant understand how I tested out of the programming test, i guess im an excellent guesser, because I didnt know half that stuff. Oh well. I just want to start playing with the Z-cam, and downloading OpenGL, and Matlab to my laptop to do the work at home. I feel like i'm rambling so im going to stop.

- Joshua Situka - 29 May 2009

I actually know what we are suppose to do now with the research. I was EXTREMELY lost at first, but with alot of work I think our team is going to do a good job. Apparently, Markerless Motion Tracking is going to be the craze in Hollywood and Video Game Design as soon as the find out an easy way to integrate the technology with the games and movies.

Please add the comments code to each blog entry so people can respond to your posts (just copy and paste the code block).

---

JoshuaSituka - 28 May 2009 I never thought I would ever blog because I used to make fun of people who did when I was younger. This is karma. So I have been in Iowa for 2 days now, and everything is going pretty well. I like the diversity of the people in the REU program and think I will have a lot of fun this summer. I am not really looking forward to hiking this evening, I rather play basketball or watch the CAVS, but I will try to make the best of it.
